Step 01: install dependencies
npm i express
npm i mongoose

Step 02: Create index.js

Step 03: Create a mongoldb database and collect the connection string

Step 04: connect with database using mongoose

```
const express = require("express");
const mongoose = require("mongoose");

const dbConString =
  "connection_string_here/database_name_here";

mongoose.connect(dbConString).then(() => {
  console.log("DB Connection done");
  const app = express();

  // our routes here

  app.listen(3000, () => {
    console.log("Server started @ 3000");
  });
});
```

Step 05: Create a schema (schema/Student.js)

```
const mongoose = require("mongoose");

const schema = mongoose.Schema({
  StudentName: String,
  RollNo: Number,
});

module.exports = mongoose.model("Student", schema);
```

Step 06 : require schema in index.js

```
const Student = require("./schema/Student");
```

Step 07: create getAll route

```
app.get("/students", async (req, res) => {
    result = await Student.find();
    res.send(result);
  });
```

Step 08: create getByID route

```
 app.get("/students/:id", async (req, res) => {
    result = await Student.findOne({ RollNo: req.params.id });
    res.send(result);
  });
```

Step 09: create delete route

```
  app.delete("/students/:id", async (req, res) => {
    result = await Student.deleteOne({ RollNo: req.params.id });
    res.send(result);
  });
```

Step 10: add json middleware

```
  app.use(express.json());
```

Step 11: create insert route

```
// insert
  app.post("/students", async (req, res) => {
    result = await Student.create(req.body);
    res.send(result);
  });
```

Step 12: create update route

```
 app.patch("/students/:id", async (req, res) => {
    result = await Student.updateOne({ RollNo: req.params.id },
req.body);
    res.send(result);
  });
```
